AM Retention Guide

Maintaining Visibility in the AI Era

- If leads or bookings slow down, the issue is rarely the platform itself. Most often, it means **one or more visibility signals in the profile needs strengthening.**
- Today, AI assistants and modern search tools recommend doctors based on **structured provider data and recent patient feedback.**
- If those signals weaken, visibility can drop. Your role is to help the doctor **identify and strengthen the missing signal.**

Example Response

"Most of the time when practices aren't seeing leads right away, it means one of the visibility signals needs strengthening. Let's take a look at your profile together and identify the fastest way to improve it."

The AI Visibility Framework

Patient discovery now happens in two steps:

1. Being Found

AI assistants scan trusted directories like WebMD to identify providers.

Key signals include:

- Structured provider data
- Specialty and credentials
- Profile completeness

AM Talk Track

"Your WebMD profile acts like a digital ID card for AI assistants. It helps them confidently identify you when patients ask for providers."

2. Being Chosen

Once AI identifies potential providers, patient reviews influence the final recommendation.

Important signals:

- Review volume
- Review recency
- Patient sentiment

AM Talk Track

"We've successfully gotten your practice found. Now the key is making sure you're chosen, and recent patient reviews play a big role in that."

Why Continuous Optimization Matters

Profiles without recent reviews may appear **inactive to AI systems.** A static profile is a declining asset. Because AI retrieval logic is a **moving target**, a subscription ensures your data stays "AI-ready."

Stay Compatible: We provide the ongoing maintenance required to match evolving LLM discovery patterns.

Stay Relevant: We position your practice where it matters most — across trusted medical platforms that patients and AI tools rely on.

The Cost of Invisibility

Removing a WebMD profile doesn't just remove a listing, it removes a trusted data source AI systems use to verify providers.
